

Insect pollination provides the UK a benefit worth **£690 million** per year¹

Insect-borne diseases like CYD can cause up to **33% yield loss** in barley²

Invasive species cost the UK economy **£1.7 billion** per year³

Webapp features - Summary

- Identify and map images taken from farmland to relevant matching known (plant/insect/species/pest) species names with time and location (with detailed co-ordinates) stamp
- Store information collected and use to accumulate and monitor movement of species over time in terms of direction, volume/concentration, speed
- This functionality can be used to manage pest control in a proactive manner and hence eliminating or at least significantly reducing crop damage and related costs for the farmers.

Product & features

- Identify plant species via image recognition
- Retrieve latest scientific data from international databases
- Store and view a map of all your observations
- Analyze invasive species movements over time

Actionable Suggestions					x

1 – Search and pick closest species from community database or add new entry manually

2 – Farmland/local level

Farmer surveys
field, uploads pictures
of what he sees

Farmer makes an
informed decision
about treatments

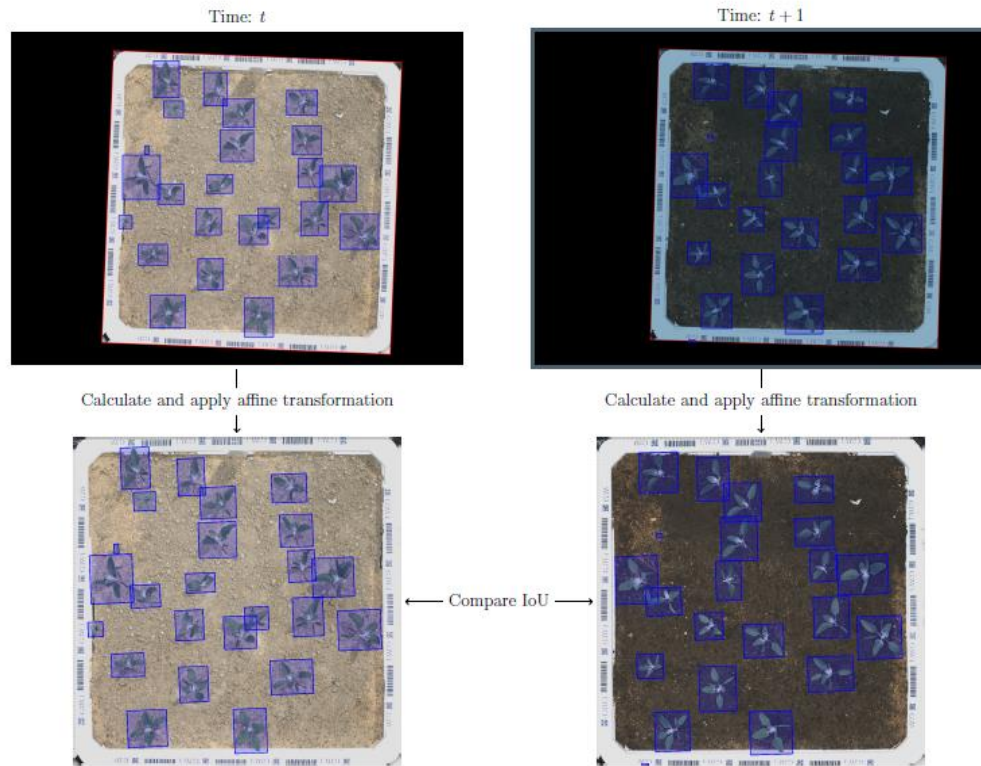

FarmSmart

1. Stores picture data
2. Identifies species
3. Extracts and maps geolocation
4. Plots metrics
 - Classification (Friend vs Pest)
 - Abundance
 - Change through time
